THE NORDIC CAPACITY CALCULATION METHODOLOGY PROJECT

In this newsletter, we would like to update you with the progress of the internal parallel run of the Nordic CCM project and the upcoming stakeholder events.

Recap: Implementation timeline of the DA flow-based methodology

The internal parallel run of the Nordic CCM project started on May 25, 2021. The external parallel run is expected to start in November 2021, subject to meeting the quality criteria defined by the national regulatory authorities (Please refer to the Nordic CCM presentation regarding [the Key Performance Indicators for the external parallel run](#)). The external parallel run shall last at least 12 months.

We will keep you posted on the development and provide an update when the starting date of the external parallel run can be confirmed.

Progress of the internal parallel run

The process of computing the flow-based parameters is stabilising. However, the market simulation results are not available yet.

Flow-based parameter data from internal parallel run results can be found on the JAO website at <https://test-publicationtool.jao.eu/nordic>, data backfill expected to be available from September 20th. In late October, we will publish Day-ahead market simulation results as well as Intraday capacities at gate opening.

Intraday capacity calculation

The Nordic TSOs plan to publish on the Nordic RSC website the description regarding the Intraday capacity calculation using the ATC extraction methodology in late September. The description will be elaborated during the dedicated workshop on October 7, 2021. Invitations to this event will be published on our web site later.

Invitations will also be sent directly to stakeholders on our updated Nordic CCM stakeholder mailing list, i.e. those who have answered our request in August for explicit consent to remain on the list, in accordance with GDPR regulation.
